

AMENDMENTS

In the Claims:

Claims 1 to 47 (Cancelled).

48. (Currently Amended) A method for configuring a medical carrier, the method comprising:

first providing a an elongate body having ~~a surface and~~ at least one common electrical conductor; and
~~next selectively mounting electrically coupling~~ at least two separately identifiable effectors to said at least one common electrical conductor on the surface, wherein said at least two separately identifiable effectors are axially spaced apart along the length of the elongate body and each of the at least two separately identifiable effectors comprises ~~a transducer and~~ an identifiable processor; ~~and~~

~~then electrically coupling the at least two effectors to the at least one common electrical conductor through a surface penetration of said surface.~~

49. (Original) A method as in claim 48, wherein the providing step comprises providing the body coupled with a cardiac pacing lead.

50. (Original) A method as in claim 48, wherein the providing step comprises providing a body having at least two electrical conductors, each conductor disposed in a separate lumen along at least a portion of the body.

51. (Cancelled)

52. (Currently Amended) A method as in claim 48, wherein said elongate body is an implantable lead ~~selectively mounting comprises exposing the at least one conductor through the surface and electrically coupling a lead from each of the at least one effector to the at least one conductor.~~

Claims 53 to 57 (Cancelled)

58. (Currently Amended) A method as in Claim 59 **[[57]]**, wherein the actuator performs a function selected from the group consisting of providing an electrical current or voltage, setting an electrical potential, heating a substance or area, inducing a pressure change, releasing or capturing a material, emitting light, emitting sonic or ultrasound energy and emitting radiation.

59. (Original) A method as in claim 48, wherein at least one of the effectors comprises both a sensor and an actuator.

60. (Original) A method as in claim 59, wherein the sensor is selected from the group consisting of pressure sensors, volume sensors, dimension sensors, temperature or thermal sensors, oxygen or carbon dioxide sensors, electrical conductivity sensors, electrical potential sensors, pH sensors, chemical sensors, flow rate sensors, optical sensors, acoustic sensors, hematocrit sensors and viscosity sensors.

61. (Original) A method as in claim 59, wherein the actuator performs a function selected from the group consisting of providing an electrical current or voltage, setting an electrical potential, heating a substance or area, inducing a pressure change, releasing or capturing a material, emitting light, emitting sonic or ultrasound energy and emitting radiation.

62. (Original) A method as in claim 48, wherein electrically coupling each of the at least one effector comprises coupling at least one lead to at least one conductor.

63. (Original) A method as in claim 62, wherein electrically coupling each of the at least one effector comprises coupling at least three leads to at least three conductors disposed in separate lumens of the body.

64. (Original) A method as in claim 63, wherein ground, power, and data leads on the effectors are connected to ground, power and data connectors in the body.
65. (Original) A method as in claim 48, further comprising encapsulating at least a portion of the body and the mounted effectors with an encapsulating material.
66. (Currently Amended) An improved method for configuring a medical carrier of the type including a plurality of actuators, wherein the improvement comprises first providing at least two separately identifiable actuators on a surface of a an elongate body, wherein said actuators are axially spaced apart along the length of the body, and wherein the at least two actuators each comprise a transducer and an identifiable processor, and then electrically coupling each of said separately identifiable actuators to at least one common conductor through a surface penetration of said surface of said body.
67. (Currently Amended) An improved method for configuring a medical carrier of the type including a plurality of systems, wherein the improvement comprises first providing separately identifiable systems, wherein at least one system comprises at least two effectors on a surface of a an elongate body that each comprise a transducer and an identifiable processor, wherein said effectors are axially spaced apart along the length of the body, and then electrically coupling each of said at least two effectors to at least one common conductor through a surface penetration of said surface of said body.
68. (Original) A method as in claim 67, wherein each system comprises:
at least one sensor;
at least one actuator; and
an electronic circuit.

Claims 69 to 95 (Cancelled).

Please enter the following new claims:

96. (New) The method according to claim 48, wherein said elongate body is adapted to be introduced to and through a blood vessel.
97. (New) The method according to claim 48, wherein each of said at least two separately identifiable effectors comprises a chip.
98. (New) The method according to claim 97, wherein said chip comprises an analog-to-digital converter.
99. (New) The method according to claim 98, wherein said chip comprises stored address information.
100. (New) The method according to claim 98, wherein said processor is configured to receive and process data from said analog-to-digital converter.
101. (New) The method according to claim 48, wherein said processor is configured to receive and process data supplied from a data conductor of said body.
102. (New) The method according to claim 52, wherein said implantable lead is a cardiac lead.
103. (New) The method according to claim 48, wherein each effector comprises 4 electrodes.
104. (New) A method for configuring a medical carrier, the method comprising:
providing an elongate body having at least two common electrical conductors;
and
electrically coupling at least two separately identifiable effectors to said at least two common electrical conductors, wherein said at least two separately

identifiable effectors are axially spaced apart along the length of the elongate body and each of the at least two separately identifiable effectors comprises an identifiable processor.

105. (New) The method according to claim 104, wherein said elongate body is adapted to be introduced to and through a blood vessel.

106. (New) The method according to claim 105, wherein said elongate body is an implantable lead.

107. (New) The method according to claim 106, wherein said implantable lead is a cardiac lead.

108. (New) The method according to claim 105, wherein each of said at least two separately identifiable electrical effectors comprises a chip.

109. (New) The method according to claim 108, wherein said chip comprises an analog-to-digital converter.

110. (New) The method according to claim 109, wherein said chip comprises stored address information.

111. (New) The method according to claim 109, wherein said processor is configured to receive and process data from said analog-to-digital converter.

112. (New) The method according to claim 104, wherein said processor is configured to receive and process data supplied from a data conductor of said body.

113. (New) The method according to claim 104, wherein each effector comprises 4 electrodes.
